Sustainable Leadership in Organizations: A Systematic Literature Review of Ethical Governance, Employee Well-Being, Green Innovation, and Public Value

Tooba Zahid* [1], Asmara Irfan[2], Abdul Sami[2]

Iqra University, Karachi, Pakistan
[2] University of Engineering and Technology, Lahore, Pakistan

Abstract

Sustainable leadership has become an important management concept as organizations face simultaneous pressure to remain economically viable, protect environmental systems, support employee well-being, and create enduring value for stakeholders. Yet the literature is dispersed across related constructs, including responsible, ethical, servant, inclusive, and transformational leadership, green human resource management, social sustainability, and public value. This review synthesizes the sustainable leadership related evidence and develops an integrative account of its principal themes, mechanisms, and research gaps. The review is organized around leadership orientation, organizational processes, and sustainability outcomes. The included papers contains empirical studies, conceptual contributions, and prior reviews, including work directly addressing sustainable leadership and innovation, sustainable leadership in public-sector organizations, and sustainable public value. The synthesis indicates that sustainable leadership is best understood as a long-term, stakeholder-oriented capability rather than a single leadership style. Its likely influence operates through ethical culture, employee participation, knowledge sharing, green innovation, organizational citizenship, and human-resource practices.

Keywords: *Sustainable Leadership; Responsible Leadership; Green Innovation; Employee Well-Being; Organizational Resilience; Social Sustainability; Public Value; Emerging Economies*

Introduction

Sustainable leadership concerns the capacity to guide organizations toward durable performance while attending to the social, environmental, ethical, and economic consequences of organizational decisions. Unlike approaches that privilege short-term output, it emphasizes continuity, responsible resource use, stakeholder relationships, and the conditions under which people and institutions can thrive over time. This orientation is relevant to private firms and public organizations alike. In the private sector, sustainability may be reflected in green innovation, responsible employment practices, and long-term organizational performance. In

public organizations, it also includes public value, legitimacy, service quality, and the responsible use of collective resources.

The literature connects sustainable leadership with several neighboring research streams. Haroon et al. (2019) explicitly examined the relationship between sustainable leadership and innovation through a systematic review, while Rehman et al. (2019) reviewed sustainable leadership practices in public-sector organizations. Sami et al. (2021) situated sustainability within public value and green public organizations. Related work examines responsible leadership and stakeholder engagement (Hashir et al., 2023), servant leadership and social sustainability (Fatima et al., 2024), ethical leadership and socially responsible behavior (Asif et al., 2025), and sustainable human-resource practices (Khan et al., 2020; Sami et al., 2025). Together, these contributions suggest that sustainable leadership is not isolated from broader organizational systems; it is expressed through decisions, routines, relationships, and institutional priorities.

Despite growing interest, the conceptual boundaries of sustainable leadership remain difficult to distinguish from adjacent leadership constructs. Ethical leadership foregrounds moral conduct and fairness; servant leadership emphasizes serving and developing followers; responsible leadership stresses stakeholder accountability; and transformational leadership emphasizes mobilizing change. Each may support sustainability, but none is automatically equivalent to sustainable leadership. A synthesis is therefore useful to clarify the common mechanisms and outcomes across these literatures without collapsing meaningful differences.

A second rationale concerns the need to connect leadership behaviors with organizational processes and sustainability outcomes. Evidence on green innovation, employee well-being, knowledge sharing, organizational citizenship, and stakeholder engagement often appears in separate streams. A coherent framework can explain how leadership orientation becomes embedded in everyday practices and under what conditions it may yield sustained organizational and societal benefits.

This review has three objectives: (1) to synthesize the sustainable-leadership-related themes represented in the supplied references; (2) to identify mechanisms linking leadership with organizational, social, environmental, and public-value outcomes; and (3) to propose a research agenda and a transparent methodological pathway for a fully reproducible PRISMA review.

Methodology

The review was guided by the question: how does sustainable leadership, including closely related responsible, ethical, servant, inclusive, and sustainability-oriented leadership approaches, connect with organizational processes and sustainability outcomes? A structured thematic synthesis was conducted using the review corpus. The review focused on conceptual and empirical contributions that connect leadership with organizational continuity, stakeholder responsibility, employee outcomes, environmental practices, innovation, or public value. PRISMA 2020 reporting domains informed the organization of the review, including evidence identification, eligibility, selection, data extraction, and appraisal.

Evidence identification was organized around terms representing the focal construct and its principal conceptual extensions: sustainable leadership, responsible leadership, ethical leadership, servant leadership, green innovation, sustainable human resource management, social sustainability, public value, stakeholder engagement, employee well-being, and organizational

This work is licensed under a Creative Commons Attribution 4.0 International License.

performance. The search logic treated leadership orientation, organizational mechanisms, and sustainability outcomes as connected but analytically distinct domains. This approach supported retrieval and organization of the supplied literature around the review question.

Selection emphasized conceptual relevance to the review question. Priority was given to publications addressing sustainable leadership directly and to studies of related leadership orientations where the stated focus connected leadership with ethical governance, stakeholder engagement, employee well-being, green innovation, organizational sustainability, or public value. Studies addressing these mechanisms or outcomes were used to develop the thematic synthesis; the broader reference list was retained as the reviewed literature.

Data were organized by publication, leadership construct, organizational setting where reported, explanatory mechanism, and outcome domain. The coding framework distinguished (a) leadership orientation and time horizon, (b) ethical and stakeholder governance, (c) employee and human-resource processes, (d) innovation and environmental practices, and (e) public value and social sustainability. The resulting themes were compared across organizational settings to identify convergent arguments, context-sensitive patterns, and areas requiring further empirical investigation.

Methodological strength was considered when interpreting the literature, with attention to the distinction between conceptual arguments, review studies, and empirical investigations. The synthesis does not treat all forms of evidence as interchangeable: conceptual papers inform construct development, while empirical studies provide context-specific evidence about associations and proposed mechanisms. Findings are therefore presented as thematic patterns rather than pooled effect estimates, and causal interpretations are reserved for evidence capable of supporting them.

Results

Sustainable leadership as a long-term, multi-dimensional orientation

The directly relevant reviews by Haroon et al. (2019) and Rehman et al. (2019) establish two important starting points: sustainable leadership has been linked to innovation and has been examined in public-sector settings. These strands imply that sustainability is not solely an environmental agenda or a corporate reporting activity. It concerns the capacity to maintain organizational effectiveness while preserving the social and institutional conditions that make future performance possible. Sami et al. (2021), through the idea of sustainable public value, extends the discussion beyond firm-level results to the wider consequences of organizational action for society.

This multi-dimensional orientation also cautions against treating a single performance indicator as sufficient evidence of sustainability. Financial performance may matter, but sustainable leadership also requires attention to employee experience, environmental impacts, stakeholder trust, organizational legitimacy, and the continuity of value creation. The literature represented in the corpus is heterogeneous, so the synthesis supports a conceptual integration more strongly than a claim that one universal model has been empirically validated.

Ethical conduct, responsibility, and stakeholder relationships

A second theme is the ethical and relational foundation of sustainability-oriented leadership. Research in the supplied list examines ethical leadership in relation to public value (Sami et al., 2016), ethical culture and public value (Sami et al., 2016), responsible leadership and stakeholder engagement (Hashir et al., 2023), responsible leadership and corporate social responsibility (Fatima et al., 2024), and ethical leadership and socially responsible organizational behavior (Asif et al., 2025). These topics converge on the proposition that sustainability depends partly on whether leaders make decisions transparently, consider affected stakeholders, and align organizational conduct with declared values.

Stakeholder engagement can improve the information available to decision-makers and make trade-offs more visible. Ethical culture can translate individual leader intentions into shared expectations and organizational routines. Nevertheless, the bibliography alone cannot establish the relative strength of these pathways or demonstrate that the relationships are causal. The more defensible synthesis is that ethics, accountability, and stakeholder inclusion are plausible organizational foundations for sustainable leadership.

Employees, human-resource practices, and social sustainability

A third theme concerns the workforce. Sustainable leadership is unlikely to endure if organizational targets are achieved through persistent employee exhaustion, exclusion, or insecurity. The supplied references address sustainable human-resource management and sustainable performance in manufacturing (Khan et al., 2020), sustainable HRM and employee well-being through perceived organizational support (Gul, 2024), servant leadership and social sustainability through organizational citizenship behavior (Fatima et al., 2024), and inclusive leadership and psychological safety (Sami & Irfan, 2023). Related studies on meaningful work and well-being (Hamza et al., 2023) and workplace gender equality and organizational justice (Sami & Irfan, 2025) broaden the social dimension.

Across these topics, employees are not merely instruments for implementing a sustainability strategy. Their capabilities, well-being, voice, and discretionary contributions can be part of the sustainability outcome itself. Organizational support, psychological safety, meaningful work, and citizenship behavior may help translate leadership values into everyday conduct. The managerial implication is that sustainability commitments should be reflected in recruitment, development, performance management, employee participation, equity, and well-being practices rather than remaining at the level of vision statements.

Innovation and environmental performance

Innovation provides a further bridge between leadership and sustainability. Ahmad and Musa (2023) address green innovation as a mediating mechanism between corporate social responsibility and sustainable organizational performance. Irfan and Sami (2024) examine green innovation and corporate sustainability in relation to environmental dynamism. Khan et al. (2020) link green human-resource management with sustainable performance in manufacturing, while Sami et al. (2025) examine green HRM and organizational sustainability in Pakistan's textile industries. Other listed research considers green knowledge integration, external stakeholder integration, and green innovation performance (Ullah et al., 2024).

This work is licensed under a Creative Commons Attribution 4.0 International License.

This stream suggests that leadership's contribution may be indirect. Leaders establish priorities, allocate resources, encourage experimentation, and connect employees and external stakeholders; organizational systems then convert these conditions into process, product, or service innovation. Environmental dynamism and regulatory pressure may shape whether those efforts are effective. The review therefore treats green innovation as a plausible pathway rather than an inevitable consequence of sustainable leadership. Stronger evidence is needed to establish temporal order, compare mechanisms, and distinguish symbolic environmental commitments from measurable environmental improvements.

Public value and institutional context

The public-sector literature adds an important contextual dimension. Work on sustainable public value and green public organizations (Sami et al., 2021), professionalism and public value (Sami et al., 2018), and the dimensions of public value in Pakistan's public-sector organizations (Sami et al., 2018) suggests that organizational sustainability in government cannot be assessed only through profitability or internal efficiency. Public organizations must also consider fairness, service outcomes, accountability, legitimacy, and societal value. Leadership practices that are effective in firms may therefore need adaptation to public institutions, where political oversight, statutory mandates, resource constraints, and multiple definitions of public interest influence decisions.

Overall, the themes support an integrative pathway: sustainability-oriented leadership shapes ethical and stakeholder governance; governance is embedded through human-resource systems, employee voice, and knowledge processes; these mechanisms support innovation and responsible operational choices; and organizational actions contribute to economic, social, environmental, and public-value outcomes. The pathway is best treated as a synthesis framework for testing, not as a confirmed universal causal model.

Discussion

The synthesis positions sustainable leadership as an integrative orientation that coordinates long-term organizational viability with social responsibility, environmental stewardship, and stakeholder value. Its distinctiveness lies less in a wholly separate set of leader behaviors than in the time horizon and breadth of consequences used to evaluate leadership decisions. Ethical, servant, responsible, inclusive, and transformational approaches may contribute to sustainability, but their contribution depends on whether they are translated into organizational systems and sustained outcomes.

The findings imply three contributions for management research. First, sustainable leadership should be studied at multiple levels. Individual leader behavior, team processes, organizational systems, and institutional context may each shape outcomes, and cross-level designs are needed to clarify how effects travel between them. Second, researchers should distinguish mechanisms from outcomes. Psychological safety, employee participation, organizational support, ethical culture, knowledge sharing, and green innovation are potential mediators; employee well-being, environmental performance, social sustainability, and public value are distinct outcomes that should not be used interchangeably. Third, context should be treated as a substantive explanatory factor. Manufacturing firms, public agencies, universities, and service organizations face

This work is licensed under a Creative Commons Attribution 4.0 International License.

different mandates and resource constraints, and sustainability-oriented leadership may operate differently across them.

For practitioners, the literature suggests that leadership development should be paired with governance and measurement. Leaders can articulate a long-term sustainability purpose, involve stakeholders in material decisions, establish ethical accountability, and protect employee voice. Human-resource policies should reinforce those commitments through fair treatment, development opportunities, meaningful work, inclusion, and environmental competencies. Innovation systems should reward learning and measurable improvements rather than symbolic initiatives. Finally, scorecards should combine economic indicators with credible social, environmental, and stakeholder measures.

The review also highlights an important evidentiary distinction. The supplied bibliography identifies relevant research streams and provides a basis for conceptual synthesis, but bibliography-level evidence cannot establish the quality, effect sizes, or causal strength of the underlying studies. The proposed framework should therefore guide a more comprehensive review and empirical testing rather than be interpreted as a definitive estimate of the field's accumulated effects.

Limitations

Several limitations characterize the sustainable-leadership literature. First, the field uses overlapping constructs—including sustainable, responsible, ethical, servant, inclusive, and transformational leadership—which can complicate comparison across studies. Second, sustainability is operationalized through diverse outcomes, ranging from organizational performance and green innovation to employee well-being, social sustainability, and public value. These outcomes are related but not interchangeable, and a single composite measure may obscure meaningful differences. Third, research settings vary in sector, institutional environment, and national context, limiting the transferability of findings across organizations. Fourth, cross-sectional and self-reported designs, where used, can constrain causal inference and increase the risk of common-method effects. Finally, relatively limited longitudinal and multilevel evidence makes it difficult to determine how leadership practices become embedded in organizational systems and generate durable outcomes over time.

These limitations point to the need for clearer construct definitions, validated multidimensional measures, stronger longitudinal designs, and comparative studies across private, public, and nonprofit organizations. Research in emerging economies should explicitly consider institutional constraints, resource scarcity, regulatory pressures, and stakeholder expectations when explaining the effectiveness of sustainable leadership.

Conclusion

Sustainable leadership is most usefully understood as a long-term, stakeholder-oriented approach that integrates ethical governance, employee well-being, innovation, environmental responsibility, and wider societal value. The literature points to organizational culture, human-resource practices, stakeholder engagement, employee voice, and green innovation as important mechanisms through which sustainability commitments may become operational. It also indicates that public value and institutional context deserve explicit attention. The central

research priority is to test these pathways with transparent methods, stronger longitudinal and multi-level designs, comparable sustainability measures, and explicit attention to contextual differences. A full PRISMA review should build on this conceptual synthesis only after a reproducible search and formal appraisal have been completed.
